

## S4 Testimonial: UNCW/NOAA Hurricane Data

As the world's most popular current meter, InterOcean's S4 Oceanographic Instrument is often in position to measure (and help predict) powerful marine events, including phenomena such as the hurricanes shown graphically below. These graphs were generated by (and are courtesy of) Dr Steven Miller, in association with the Univ. of North Carolina -Wilmington (UNCW), NOAA, and the National Underwater Research Center (NURC), who combine to operate Aquarius –the world's only underwater laboratory. These graphs are representative of the 10 years NURC and NOAA have been monitoring extreme conditions with S4's in this location, and 25 years of precision data the S4 has provided research institutions and offshore industries worldwide.
